

The soluzione Cockpit - KPIs clearly in view

Create transparency. Guide progress. Increase impact.

The soluzione Cockpit is the central control platform for all digital learning initiatives. It provides transparency regarding usage and learning progress, transforming data into concrete, actionable insights.

This gives companies real control and valuable insights. Who is learning? Which measures are effective? Where is action needed? The cockpit provides these insights with clear visualisations, intelligent filtering options and direct interaction capabilities.

E-learning service: Understanding data and making informed decisions

The Cockpit provides quick access to all relevant metrics. The **E-Learning Services** dashboard offers comprehensive statistics on the use of learning content – ranging from user activity and campaign effectiveness to the use of individual content items.

Functions

- Central display of all relevant learning and usage data
- Intuitive diagrams with additional information
- Overview of employee learning and testing status

The entire data view is controlled via the filter area. Here you define which data you want to analyze – sorted by time, language, and topic.

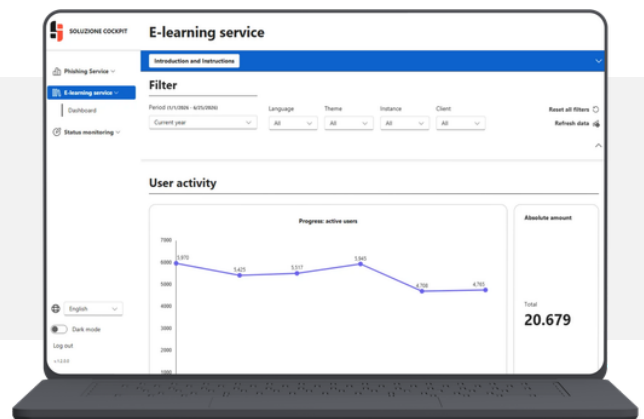

The filter area allows:

- A selection of predefined or custom time periods.
- Restriction to specific topics or languages.
- Quick reset to default values.

Your added value

Turn data into targeted decisions. Rather than receiving general reports, you will receive precisely the analysis you need for management purposes. This reduces the effort required for analysis and increases the effectiveness of your actions.

Status Monitoring: Progress under control

With status monitoring, you can keep a detailed eye on the learning and testing progress of your employees at all times.

Functions

- Overview of all courses with status distribution
- Transparency regarding what has not been started, is in progress, or has been completed
- Detailed insight at the individual level (if desired)
- Filter options by status, progress, and activity
- Sorting and search functions for targeted analyses

A complete status report is also available for tests and certificates, including success rates and processing status.

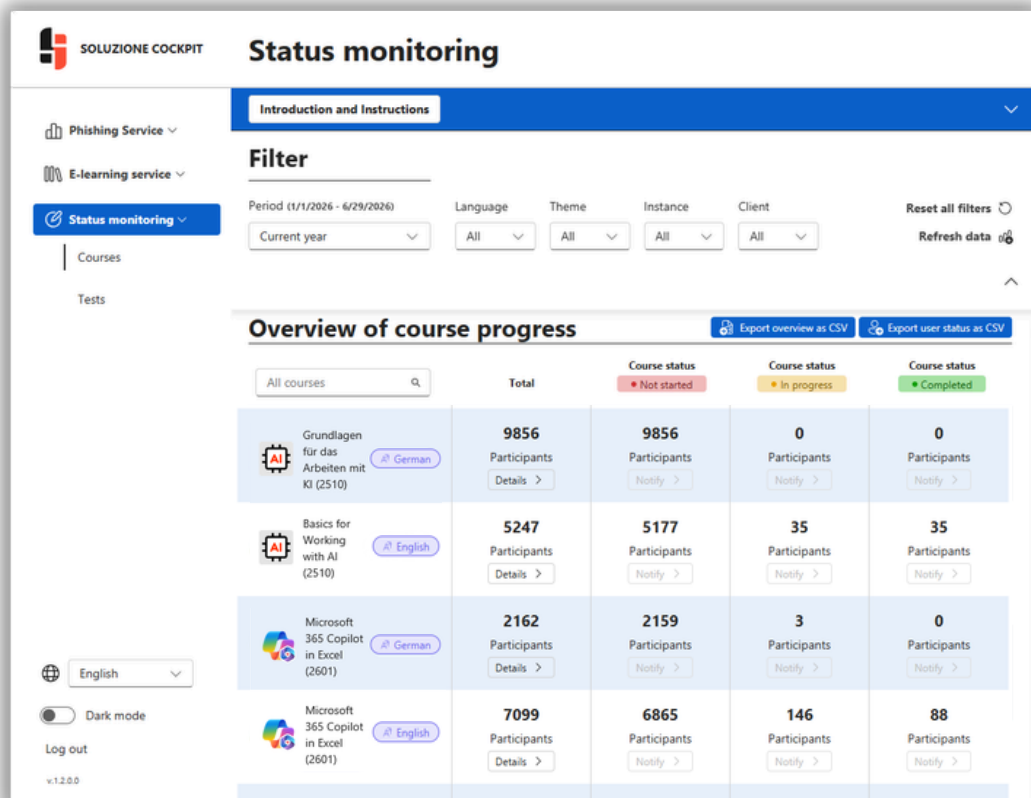

Your added value

You can identify where action is needed immediately and react directly.

Specifically, this means:

- Early adjustments in case of low participation rates
- Transparent performance measurement for internal stakeholders
- Reliable basis for compliance documentation

Email notifications: Communication that works

The soluzione Cockpit enables you to communicate with your employees directly and in a targeted manner, both automatically and on a large scale.

Functions

- Send email notifications directly from the cockpit.
- Select specific target groups based on their status.
- Communicate with individuals depending on their progress (e.g. not started, active or completed).
- Use the preview function to view all emails.
- Provide shipping status information.

Emails can be sent to specific groups based on their status, ensuring that each learner receives information that is relevant to them. Staggered delivery also helps to ensure reliable delivery and prevent emails from being classified as spam.

Your added value

Boost participation and completion rates without extra manual effort.

Targeted communication can motivate inactive users, remind them of deadlines and acknowledge successes. Combined with notifications, monitoring becomes active control: you can see the status and actively influence it.

The result: greater learning progress, higher compliance, and measurable efficiency gains in your training measures.
